OAuth 2.0

• The OAuth 2.0 Authorization Framework allows for authorization to be performed by an external entity
  • No usernames or passwords need to be provided by the client
• If supported by a service, configuration of the OAuth 2.0 server is performed as another type of external account provider
  • Specify the server address
  • If needed, specify the issuer string and the signing keys of the server
• Redfish services can accept signed tokens in the Authorization HTTP request header
  • Token contains identifier for the OAuth 2.0 server, client, and privileges
  • If the signature of the token is valid, the service gives the client the privileges described in the token for the operation
SmartNICs

- New additions to support modeling use cases for SmartNICs
  - `AllowDenyCollection` added to `NetworkDeviceFunction` to show firewalling configurations
  - `ProcessorCollection` added to `NetworkAdapter` to show offload processors dedicated to a SmartNIC
  - `DPU` (Data Processing Unit) value added to `SystemType` in `ComputerSystem` for showing a system-view of an SoC on a SmartNIC
- Establishing patterns for modeling SmartNICs with existing schemas
  - Advanced Communications Device (ACD) model is the base model
  - Each SmartNIC has its own `Chassis` resource
  - `Processor` and `ComputerSystem` resources are used to represent the offload capabilities of a SmartNIC
  - `AddressPool` in fabrics represents switching-related configurations
SoC-based SmartNICs

*SystemType = “DPU”*

*NDF = Network Device Function*
FPGA-based SmartNICs

*NDF = Network Device Function
NEW Control schema

- Concepts heavily leveraged from Sensor
- Describes an individual control point plus associated sensor(s) that measures the effects of that control point
  - Also known as an “effector” in some specifications
- SetPoint is the primary focus for end users
  - The desired value for a Sensor Reading instance resulting from the Control setting
  - SettingMin and SettingMax can specify a range of values rather than a single point
- ControlLoop object exposes coefficients used in a control loop algorithm
- Schema excerpts defined in EnvironmentMetrics, Memory, and Processor for PowerLimitWatts and OperatingSpeedRangeMHz
  - These use cases complete the transition from the deprecated Power and Thermal schemas (fully replaced by PowerSubsystem and ThermalSubsystem)
  - PowerLimitWatts limits power consumption of a resource
  - OperatingSpeedRangeMHz provides range of allowed speeds for a Memory or Processor device
NEW Battery and BatteryMetrics schema

- Various system designs incorporate battery modules
  - Example: A battery to provide power to NVDIMMs so that DRAM contents are flushed to flash when power is lost
  - Does not include “simple” batteries, such as a coin cell battery for an RTC

- **PowerSubsystem** was updated to include a **BatteryCollection**
  - The members of the collection represent the batteries in a **Chassis**
  - Contains FRU information and metrics associated with the battery
NEW Power Shelf support

- Product category added to PowerDistribution schema
  - Feedback received that requested support of this OCP-defined category
- A unit intended to power a rack (or similar group) from a common output
  - Primary difference from other power equipment is the presence of power supplies
NEW Cables

- Cable resources for tracking inventory info and connectivity
  - Connectivity between Chassis, Ports, and arbitrary Resources
  - Exposes cabling without requiring extra links to report logical connections
- Properties are user-updatable for the option of manual management
  - e.g. Physical status, connectivity types, cable types, identifiers
- **CableCollection** can be found off ServiceRoot
NEW KeyService, Key, and KeyPolicy schemas

- A **KeyService** resource can be found off **ServiceRoot**
  - This is for configuration of keys within a service
  - External key management functions have also been added to **ComputerSystem** (see **KeyManagement** property)
- Each **Key** resource contains the key string and format of the key
- Each **KeyPolicy** resource contains administrative settings for usage of keys, such as allowed hash algorithms and cryptographic functions
- Initial use cases identified for NVMe-oF boot key management
  - **KeyService** contains a **KeyCollection** named **NVMeoFSecrets** for storing NVMe-oF keys to access subsystems
  - **KeyService** contains a **KeyPolicyCollection** named **NVMeoFKeyPolicies** for managing how system software is allowed to use the NVMe-oF keys
NVMe-oF Boot Key Management

- Clients install NVMe-oF keys by performing a POST to the NVMeoFSecrets collection found in KeyService
- System software (UEFI and OS) access the key information in order to establish NVMe-oF connections to remote subsystems
  - UEFI discovers the installed keys and configures ACPI entries to specify the available boot paths
  - ACPI entries contain a reference to the URI in the Redfish model for a given key
  - The OS uses this information to re-establish NVMe-oF connections to remote subsystems

Migration to new resource definitions

- Three schemas have been replaced by new definitions, with the existing schemas deprecated in this release
  - **Power** – replaced by PowerSubsystem, PowerSupply, PowerSupplyMetrics, and EnvironmentMetrics
  - **Thermal** – replaced by ThermalSubsystem, Fan, and EnvironmentMetrics
  - **NetworkPort** – replaced by Port (existing, last revised in 2020.3)
- New implementations should use the new schemas
  - Services can implement both “old” and “new” to provide a migration path
  - New implementations can implement both if consistency with existing product families or client software is desired
- Deprecated schema files can be identified via:
  - CSDL: “Redfish.Revisions” annotation with “RevisionKind” of “Deprecated”
  - JSON schema: “deprecated” attribute in the un-versioned schema file
  - OpenAPI YAML: “deprecated” attribute in the un-versioned schema file
NEW PowerSubsystem and supporting schemas

- Replaces the Power schema with improved definitions
- PowerSubsystem
  - The equipment and connectivity that provides power to a Chassis
  - Redundancy group information
    - Streamlined definition from existing Redundancy object
  - Lays groundwork to populate batteries and other external power sources
- PowerSupply
  - Resource Collection for individual power supply (and bay) resources
- PowerSupplyMetrics
  - Support measurements for a well-instrumented power supply
NEW ThermalSubsystem and supporting schemas

• Replaces the Thermal schema with improved definitions

• ThermalSubsystem
  • The equipment and connectivity that provides cooling for a Chassis
  • Redundancy group information
  • Lays groundwork to populate other cooling equipment

• ThermalMetrics
  • Summary of temperature readings for interoperable comparison
    • Allows implementation to assign a particular sensor to a well-known “purpose”
    • Object contains readings for “Ambient”, “Intake”, “Internal”, and “Exhaust”
  • Array of all temperature readings for a Chassis

• Fan
  • Resource Collection for individual fan (and bay) resources
NEW EnvironmentMetrics schema

- Common schema used to report sensor readings specific to a Facility, Chassis or a device (e.g. Drive, Processor, Memory)
- Provides consistent naming for the sensor readings across the model
- Defined readings include:
  - Energy (kWh)
  - Fan speed (percent and RPM)
  - Humidity
  - Power
  - Temperature
- Resource contains schema excerpts with links to the Sensor resource that reports each Reading
Power and Thermal Migration Summary

- **Power** and **Thermal** resources are completely replaced
- **Fans[0..n]** and **PowerSupplies[0..n]** become Resource Collections
  - Contain mostly static data for these devices (and their “bays”)
  - PowerSupply links to a PowerSupplyMetrics resource for sensor readings
- **Voltages[0..n]** and **Temperature[0..n]** become Sensor resources
  - Temperature readings now summarized in ThermalMetrics
  - Voltage readings move to PowerSupplyMetrics or the Sensor collection
- **PowerControl[0..n]** object split along functional lines
  - Power limits move to the appropriate resources
- Sensor excerpts added to EnvironmentMetrics resources as needed
  - Much easier to correlate “CPU readings” by starting at Processor instead of searching Sensor collection
Power and Thermal resource tree additions

- Power Supply Metrics
- Power Supply collection
- Power Supply
- Power Subsystem
- Environment Metrics
- Thermal Subsystem
- Thermal Metrics
- Fan collection
- Fan
- Sensor Collection
- Sensor

NEW *Conditions* array in common *Status* definition

- Array of Messages and additional data which describe conditions that cause the *Health* or *HealthRollup* to be in “non-OK” states
  - Describes active conditions that need attention or user awareness
  - Not a replacement for Events or Log entries
- Definition within *Status* allows support to appear throughout model
  - Client can detect support by presence of the empty *Conditions* array
- A *Condition* element may contain an *OriginOfCondition*
  - Link to a subordinate or related resource where the condition originated
  - Absence indicates the origin of the condition is within the resource
- Allows for a unified “follow the red” pathway through the model
  - New Base message “ConditionInRelatedResource” defined to indicate a condition exists in a subordinate or related resource
Example **Conditions** array

```
"Status": {
    "Health": "Critical",
    "HealthRollup": "Warning",
    "State": "Enabled",
    "Conditions": [{

NEW Host Interface Specification Updates

• New credential bootstrapping feature added to the Redfish Host Interface Specification v1.3

• Added a set of IPMI commands to allow host software or the operating system to generate credentials for itself without requiring a-priori knowledge about the Redfish service
  • Previous UEFI variable mechanism for transporting host credentials has been deprecated in favor of this approach

• Additions to the HostInterface resource to control whether the credential bootstrapping feature is enabled, and control the role assigned to the bootstrap account
NEW Connection schema

- Added *Connection* to the fabric model
- A *Connection* resource is used to express the types of resources an endpoint can access when connected to another endpoint within a fabric
  - For example, if a storage initiator connects to a storage target, which volumes can the initiator access
- *Connection* maps *Endpoint* resources to other resources, and specifies the permissions for the resource
NEW StorageController schema

- Created StorageController to address scalability concerns
  - The Storage schema currently contains an object array for controllers
    - This property works for traditional HBAs or RAID adapters that have a physical controller, where the Storage resource contains only one or two controllers
  - Added a link in Storage to a StorageController resource collection
- A StorageController resource collection allows for cases where a single storage subsystem will have a more dynamic set of controllers
  - For NVMe-oF, controllers are created and retired as NVMe-oF hosts connect or disconnect from NVMe-oF targets
NEW NVMe-oF modeling using Redfish

- Additions made to the data model to support NVMe-oF
  - Storage added to ServiceRoot for showing externally accessible storage subsystems
  - Connection added to Fabric to allow mapping of Endpoints to other resources, such as Volumes
  - Drives added to Chassis to show drives within an enclosure
- Endpoints are used to represent NVMe-oF hosts and interfaces on an NVMe-oF subsystem
  - An Initiator Endpoint represents a host, and contains the host’s NQN
  - A Target Endpoint represents an interface to the subsystem, and contains the subsystem’s NQN as well as a reference to the NetworkDeviceFunction representing the physical interface
NEW NVMe-oF Modeling in Redfish
Port schema updates, migration from NetworkPort

- Large overlap between Port and NetworkPort
  - Both schemas filled essentially the same purpose
  - Standardize on Port going forward
  - Properties added to Port that were present only in NetworkPort
- References to NetworkPort deprecated and references to Port added
  - NetworkAdapter
  - NetworkInterface
  - NetworkDeviceFunction
- Autospeed negotiation for network adapters now explicitly supported
  - AutoSpeedNegotiationEnabled - allows turning negotiation on/off
  - ConfiguredNetworkLinks - set of lane speed/count possibilities to which autospeed negotiation is restricted
NEW Diagnostic Data support in LogService / LogEntry

• Diagnostic data can be collected at any time and is stored in a file to troubleshoot problems that have occurred
• The data may consist of a “crash dump”, application core, network configuration, system inventory configuration, journal log, etc.
• LogService CollectDiagnosticData action collects the diagnostic data
  • Parameters DiagnosticDataType and OEMDiagnosticDataType
• LogEntry adds support for referencing a diagnostic data file
  • AdditionalDataSizeBytes - Size of the additional data file
  • AdditionalDataURI - URI of the additional data file
  • DiagnosticDataType - Type of diagnostic data
    • Types include: Manager, OEM, OS, and PreOs
  • OEMDiagnosticDataType – OEM-defined diagnostic data type
    • Used when DiagnosticDataType is OEM
**NEW InfiniBand support**

- Added *InfiniBand* to *NetDevFuncType* in *NetworkDeviceFunction* to be able to identify network devices that support InfiniBand
- Added *InfiniBand* property to *NetworkDeviceFunction* for containing InfiniBand specific properties
  - Port GUID
  - Node GUID
  - System GUID
  - MTU capabilities and configuration
NEW `LocationIndicatorActive` property

- Deprecates and replaces `IndicatorLED` property throughout the model
  - `IndicatorLED` improperly exposed hardware implementation details
  - Redfish attempts to model usage semantics rather than physical characteristics
  - This caused interoperability issues discovered during Redfish Plugfests
    - Some vendors use “On” as the active state, others use “Blinking”
    - Some vendors use “Off” as the inactive state, other use “On”
  - `LocationIndicatorActive` property is a simple Boolean
    - True if the locator function is active, False if it is not in use
    - Added to `Assembly`, `Circuit`, `Chassis`, `ComputerSystem`, `Drive`, `Memory`, `Outlet`, `PCleSlots`, `Port`, `Processor`, `Switch`
- For compatibility with existing clients, services should:
  - Implement both properties in `ComputerSystem`, `Chassis`, `Drive`, `Switch` instances where `IndicatorLED` already exists
  - Reflect changes (from user PATCH operations) in both properties
  - Replace `IndicatorLED` support in `Circuit`, `Outlet` as these are new schemas
Remote console and Virtual Media updates

- Remote console and virtual media properties moved to ComputerSystem
  - Allows clients to locate functionality in multi-node
- New VirtualMediaConfiguration object, VirtualMediaCollection link
  - Configuration object provides connection information per system
  - No changes to VirtualMedia resource collection definition

JSON schema file update

- Each Redfish schema version generates a JSON schema file
  - e.g. ComputerSystem.v1_9_0.json, ComputerSystem.v1_9_1.json
- The “un-versioned” JSON schema file is updated for each release
  - e.g. ComputerSystem.json
  - This file contains an “anyOf” array of references to every release
- Problem: As the “anyOf” array included every release, it created issues:
  - Large number of files referenced is a performance burden for tools
    - For example, ComputerSystem has 70 references
  - Schema errata corrected by later releases are still exposed to users
    - Errors in schema definitions (e.g. invalid URIs, etc.) break schema-based tools
    - To avoid known and fixed issues, those files must be removed from references
- Solution: Un-versioned JSON schema files now contains only the highest-numbered errata for each minor version
  - e.g. ComputerSystem version v1.10.0, v1.9.1, v1.8.1, v1.7.2, etc.
  - This significantly improves tool performance and avoids known issues
    - e.g. ComputerSystem schema drops from 70 references to 12 references

    - Units shall be explicitly defined for each ReadingType to avoid mis-identification
    - Large-scale difference in magnitude handled by separate ReadingTypes (e.g. mW, kW)
  - *Thresholds* – Structured set of thresholds with a common definition
    - Severity, hysteresis, etc.

- Use RedfishVersion in ServiceRoot to check protocol version
  - Values of “1.6.0” or higher support OpenAPI and fixed URI definitions
  - For values below “1.6.0”, URI tree structure is not specified, clients continue to discover path from ServiceRoot
- Examples:
  - “1.6.0”, “1.6.1”, “1.7.5”, “1.10.2” : supports OpenAPI
  - “1.5.1” : does not support OpenAPI – URI structure cannot be guaranteed

• An “Interoperability Profile” provides a common ground for Service implementers, client software developers, and users
  • A profile applies to a particular category or class of product (e.g. “Front-end web server”, “NAS”, “Enterprise-class database server”)
  • It specifies Redfish implementation requirements, but **is not** intended to mandate underlying hardware/software features of a product
  • Provides a target for implementers to meet customer requirements and a baseline of schema and property-level support for software developers utilizing Redfish
  • Enable customers to easily specify Redfish functionality / conformance in RFQs
• Specification (DSP0272) defines a machine-readable Profile definition
  • JSON document designed to be human-readable and easy to create
• Profiles will be created by DMTF, partner organizations, and others
  • DMTF will provide re-publication via the Redfish Developer Hub
  • Published profiles will be included in a bundle for download (DSP8013)
• DMTF open source utility available to test conformance to a Profile
